1. Description of your topic of interest and why you chose it

I chose a Dataset related to music as I love listening to music, see performances, play and sing on my own, and also because I figured data in the music industry is interesting to analyze. This is why Spotify's wrapped every year are such a success.

I first chose a Music and health dataset but a problem append on the data. As I thought it could be interesting to work with a map as seen in class, I figured this Eurovision Dataset could perfectly join the music I want to work on and one way I want to present my work.

2. The business case or personal objective of the project

My objective is to get as much information as possible and try to display results on a story using the map view to compare the different countries at Eurovision.

3. Any specific outcomes the project must accomplish

Since I changed Datasets at the end of the given time, my main obstacle to overcome is understanding and working on the dataset with a short amount of time.

4. A description of the dataset to be used, including an explanation of why you chose this data and how you might present your findings

The Dataset contains 3 files, but the main one eurovision_meta that'll be working on has 30 columns and 648 rows. It contains data about eurovision between 1998 to 2012. There are ranking, points, and many other numerical columns I can use, and we have the country for each performance which can help me communicate my results through a map.

Looks Good Julie!
